

UI AUTOMATION

The Folder Structure:

Scenario 1: Add Multiple Products and Cart Validation:

I logged in using a demo user, then searched for and added three different products (a laptop, a coffee maker, and a book) to the cart one by one. After opening the cart, I validated that all three products were actually present, their names matched what was added, each had an image showing, and the quantity for each was correct. I also checked that the cart header showed the right item count (3 items) and that the subtotal matched the sum of all three product prices.

Scenario 2: Payment Processing Error Validation:

I logged in, added a product to the cart, and went through checkout to the payment page. I selected the "Payment Success" option but entered the specific card number the site flags to simulate a processing error. After placing the order, I validated that the correct error message was displayed, confirmed the user was NOT taken to a confirmation page (still on the Payment step, meaning no order was placed), and checked that all the entered card details were still filled in — so the user could retry without re-typing everything.

Running evidence in terminal:

The CI pipeline:

Initial commit #1
